

Videoconferencing Solution Nuernberger Lebensversicherung

Overview for troubleshooting. **Red** marked text describes features which are currently not working as intended.

24. Januar 2017

Short description:

The Polycom Group Series are registered directly with the OSV. They are all managed with the dynamic management feature by the Resource Manager.

To allow this, a user profile for every Video Endpoint was created that mirrors the corresponding number and password from the OSV. **A network provisioning profile that uses these provisioning credentials for registering the subscriber is applied to all endpoints.**

Conferences are established either by calling the other video endpoint directly for one to one conferences or by dialing into the central software MCU for three or more participants.

Content can be provided by i.e. notebooks connected to the HDMI input of one endpoint.

It will be delivered in an additional video stream on direct calls and instead of the camera picture on calls using the conference bridge.

The DMA currently serves no purpose.
